

**Assignment 1:** Write a SELECT query to retrieve all columns from a 'customers' table, and modify it to return only the customer name and email address for customers in a specific city.

Solution:-

Retrive all the cloumns from the customers table:

```
SELECT *FROM customers;
```

Return only the customer name and email address for customers in a specific city, let's say the city is 'SKP'.

```
SELECT customer_name, email_address  
FROM customers  
WHERE city = 'SKP';
```

This query selects the customer\_name and email\_address columns from the customers table and applies a Where clause to filter the results to include only customers from the specified city(SKP).

**Output:-**

```
customer_name | email_address
```

```
-----
```

```
John          | john@gmail.com
```

```
joseph        | joseph@gmail.com
```
